

CONDENSATION

Water vapour condenses into tiny water droplets. These droplets gather together to form clouds.

PRECIPITATION

As the droplets get larger, it becomes too heavy and gravity brings it down to Earth as rain.

THE WATER CYCLE

TRANSPIRATION

EVAPORATION

Water is heated up and turned into water vapour

INFILTRATION

Rain falls back into oceans and seas. It also falls on land where the water will seep back into the ground for plants to take in.
